## Adapter

Allows objects with incompatible interfaces to collaborate

- You can create an adapter. This is a special object that converts the interface of one object so that another object can understand it.
- How it works:
  - 1. The adapter gets an interface which is compatible with one of the existing objects.
  - 2. Using this interface, the existing object can safely call the adapter's methods.
  - 3. Upon receiving the call, the adapter passes the request to the 2<sup>nd</sup> object, but in a format and order that the 2<sup>nd</sup> object expects.
