- We'll build a **Singleton Pattern** in JavaScript to fetch data from the *Course Syllabus* API. This pattern ensures only one instance of ApiService is created, centralizing access to authenticated API calls.

Step 1: Add a Private Static Field

ApiService
-#instance
+fetchUser()

- We'll start by creating a private static field inside the `ApiService` class to store the singleton instance. This field will ensure only one instance of `ApiService` exists.
