# Step 2: Public Static Method for Getting the Singleton Instance

ApiService
-#instance
+getInstance() +fetchUser()

- Next, we'll create a static getInstance$ method that will return the singleton instance. This method will later handle instance initialization if it doesn't already exist.

Step 3: Implement Lazy Initialization

```
        ApiService
-------------------------
-#instance
-------------------------
+getInstance()
+fetchUser()
```

- We'll add lazy initialization in getInstance$ so the ApiService instance is created only on the first call. The method will return the existing instance on subsequent calls.
